

## OpenSource

As the name suggests, with OpenSource software the source (code) is accessible to everyone. Linux is an OpenSource operating system with a huge collection of software, which is also OpenSource.

## Free of charge

Software for Linux is usually OpenSource and free of charge (there are exceptions). Around the globe many developers work on Linux in their spare time without pay (there are exceptions). Donations are a great way to support projects. Bigger software projects have professionalized handling donations (association).

## Open Source and secure

Linux has the reputation to be very secure.

Since the source code is constantly inspected by hundreds of people all the time, errors become evident quickly and are also resolved quickly. Once an error was detected, it is openly announced, the software gets updated and is made available as fast as possible. Linux systems usually update automatically - with special focus on security.

## Contribute

OpenSource applications invite people to join and contribute. If you are a developer, a designer, a texter / translator or tester ... there's a lot to do and helping hands are welcome.

## Perfect for education

Linux is popular in universities. Due to its openness, the principles can be understood clearer and unlock creative potential. By participating in an OpenSource project you will learn a lot from other experienced contributors.

## A small selection

These OpenSource software you may already know:

1. [Firefox](#) - der Web-Browser
2. [Krita](#) - das Zeichenprogramm
3. [LibreOffice](#) - das Office-Paket
4. [Gimp](#) - das Bildbearbeitungsprogramme
5. [OBS](#) - die Streaming Video Suite
6. [Blender](#) - das 3D Programm
7. [Audacity](#) - der Audio-Editor
